${ }^{\text {a }}$ Since 2006: registered jobseekers instead of registered unemployed. (The data concern the closing date of each month.) From the 1st of November, 2005 the Employment Act changed the definition of registered unemployed to registered jobseekers.
${ }^{\mathrm{b}}$ Those receiving the discontinued income support supplement were included in the number of those receiving income support supplement up to 2004, and in the number of those receiving regular social assistance from 2005 to 2008. From 2009, those receiving social assistance were included in a new support type, the on call support.
${ }^{\text {c }}$ The new IT system introduced at the NFSZ in 2008 made the methodological changes possible:

1) The filtering out of those returning after or starting a break from the number of those entering or leaving the different types of jobseeking support. The main reasons for a break are work for short time periods, receipt of child support (GYES) or, TGYÁS, or involvement in training.
2) Taking into account in the previous period the number of those entrants, for whom the first accounting of the jobseeking support was delayed due to missing documentation.
Comparable to 2009: 141.5 thousand people.

${ }^{\text {a }}$ The new IT system introduced at the NFSZ in 2008 made the methodological changes possible:

1) The filtering out of those returning after or starting a break from the number of those entering or leaving the different types of jobseeking support. The main reasons for a break are work for short time periods, receipt of child support (GYES) or, TGYÁS, or involvement in training.
2) Taking into account in the previous period the number of those entrants, for whom the first accounting of the jobseeking support was delayed due to missing documentation.
Comparable to 2009: 134.1 thousand people.
${ }^{\mathrm{b}}$ Those receiving the discontinued income support supplement were included in the number of those receiving income support supplement up to 2004, and in the number of those receiving regular social assistance from 2005 to 2008. From 2009, those receiving social assistance were included in a new support type, the on call support.
${ }^{\mathrm{c}}$ The number financed from the MPA Decentralized Base.
Note: The closing numbers from October of each year. For the percentage data, the sum of those registered and those taking part in labour market programs $\approx 100.0$.
Source: FH.

Note: the results indicate the earnings differentials of the various groups relative to the reference group in log points
(approximately percentage points). All parameters are significant at the 0.01 level.

All equation specifications control for industrial classification. We do not include the parameter estimates of the industrial classification variables, since the classification changed several times between 1998 and 2009. The region parameters can be seen in Table 9.6.
Reference category: women, with leaving certificate (general education certificate), in the business sector, working in the Central-Transdanubia region.

Note: Excludes special schools. Beginning with the 2001/2002 schoolyear, students in grades $5-8$ who attend a 6 or 8 year high school are included in the number of high school students. The reason for the missing data in 2000/01 is that the NEFMI was unable to carry out the analysis based in the source data due to technical difficulties.

Note: the results indicate the earnings differentials of the various groups relative to the reference group in log points (approximately percentage points). All parameters are significant at the 0.01 level.
All equation specifications control for industrial classification. We do not include the parameter estimates of the industrial classification variables, since the classification changed several times between 1997 and 2009.
Reference category: women, with leaving certificate (general education certificate), in the business sector, working in the Central-Transdanubia region.

${ }^{\text {a }}$ The guaranteed minimum wage pertains to employees who have completed at least a secondary education level and are employed in an occupation requiring skills.
${ }^{\mathrm{b}}$ Guaranteed minimum wage of skilled workers less than 2 years of practical experience.
${ }^{\mathrm{c}}$ Guaranteed minimum wage of skilled workers with at least 2 years of practical experience, or who are above the age of 50 .
${ }^{\mathrm{d}}$ Beginning in 2009. January 1, the specification regarding the 2 years of practical experience and those above the age of 50 was dropped from the legislation.
Note: As of September 2002, minimum wage earners do not pay personal income tax. (As a result of this measure, the net minimum wage increased by 15.9 per cent.)

## DESCRIPTION OF THE MAIN DATA SOURCES

The data have two main sources in terms of who gathered them: the regular institutional and population surveys of the Hungarian Central Statistical Office, and the register and surveys of the Employment Office.

## CSO LABOUR FORCE SURVEY - KSH MEF

The Hungarian Central Statistical Office has been conducting a new statistical survey since January 1992 using the experience of the pilot survey carried out in 1991 - to obtain ongoing information on the labour force status of the Hungarian population. The Labour Force Survey is a household survey which provides quarterly information on the non-institutional population aged $15-74$. The aim of the survey is to observe employment and unemployment according to the international statistical recommendation based on the concepts and definitions recommended by the ILO independently from the existing national labour regulations or their changes.

In international practice, the labour force survey is a widely used statistical tool to provide simultaneous, comprehensive and systematic monitoring of employment, unemployment and underemployment. The survey techniques minimise the subjective bias in classification (since people surveyed are classified by strict criteria) and provide freedom to also consider national characteristics.

In the Labour Force Survey the population surveyed is divided into two main groups according to the economic activity performed by them during the reference week:

- economically active persons (labour force) and
- economically inactive persons.

The group of economically active persons consists of those being in the labour market either as employed or unemployed during the reference week.

The definitions used in the survey follow the ILO recommendations. According to this those designated employed are persons aged $15-74$ who, during the reference week:

- worked one hour or more for pay, profit or payment in kind in a job or in a business (including on a farm), - worked one hour or more without payment in a family business or on a farm (i.e. unpaid family workers),
- had a job from which they were temporarily absent during the survey week.
Persons on child-care leave are classified according to their activity. Conscripts are considered as economically active persons, exceptions are marked in the footnotes of the table.

From the survey's point of view the activities below are not considered as work:

- work done without payment for another household or institute (voluntary work),
- building or renovating of an own house or flat,
- housework,
- work in the garden or on own land for self-consumption.
Unemployed persons are persons aged 15-74 who:
- were without work, i.e. neither had a job nor were at work (for one hour or more) in paid employment or self-employment during the reference week
- had actively looked for work at any time in the four weeks up to the end of the reference week,
- were available for work within two weeks following the reference week or were waiting to start a new job within 30 days (since 2003 within 90 days).
Active job search includes: contacting a public or private employment office to find a job, applying to an employer directly, inserting, reading, answering advertisements, asking friends, relatives or other methods.

The labour force (i.e. economically active population) comprises employed and unemployed persons.

Persons are defined economically inactive (i.e. not in the labour force) if they were neither employed nor unemployed, as defined.

Passive unemployed (known as "discouraged persons" according to the ILO concepts) are persons aged 15-74 who desire a job but have given up any active search for work, because they do not believe that they are able to find any.

The Labour Force Survey is based on a multi-stage stratified sample design. The stages of sampling are defined as follows: primary sampling units (PSUs) are enumeration districts (EDs) and secondary sampling units (SSUs) are dwellings in settlements with 15,000 or more inhabitants, while PSUs are settlements, SSUs are EDs and ultimate sampling units are dwellings in all other cases.

The main indicators of the labour market are representative for regions.

The Labour Force Survey sample is basically a sample of dwellings, and in each sampled dwelling, labour market information is collected from each household and from each person aged 15-74 living there. For 1998, the quarterly sample contains about 33,000 households and 66,000 persons. The sample has a simple rotation pattern: any household entering the sample at some time is expected to provide labour market information for six consecutive quarters, then leaves the sample permanently. The samples of two consecutive periods tend to be less than 5/6, which would be obtained at a 100 per cent response rate.

In the Labour Force Survey sample design strata are defined in terms of geographic units, size categories of settlements and area types such as city centres, outskirts, etc.

## CSO LABOUR FORCE ACCOUNTING CENSUS - KSH MEM

Before the publication of the Labour Force Survey the annual Labour Force Account gave a view of the total labour force in the period between the two censuses.

The Labour Force Account, as its name shows, is a balance-like account which compares the labour supply (human resources) to the labour demand at an ideal moment (1 January). Population is taken into account by economic activity with a differentiation between those of working age and the population outside of the working age.

Source of data: Annual labour survey on employment on 1st January of enterprises and of all government institutions, labour force survey, census, tax records and social security records, and company registry. Data on unemployment comes from the registration system of the Employment Office. Source of the labour force: working age population, active earners outside of working age and employed pensioners.

## CSO INSTITUTION-BASED LABOUR STATISTICS - KSH IMS

The source of data is the monthly (annual) institutional labour statistical survey. The survey range covers enterprises with at least 5 employees, and public and social insurance and non-profit institutions irrespective of the staff numbers of employees.

The earnings relate to the full-time employees on every occasion. The potential elements of the prevailing monthly average earnings are: basic wages, bonus-
es, allowances (including miner's loyalty bonus, any Széchenyi-grant), payments for time not worked, bonuses, premiums, wages and salaries for the 13th and more months.

Net average earnings are calculated by deducting from the gross average earnings the actual personal income tax, employee's social security contributions, etc., according to the actual rates (i.e. taking into account the threshold concerning the social security contribution). It does not take into account the impact of the new tax allowance related to the number of children. The personal income tax is calculated by the actual withholding rate applied by the employers when disbursing monthly earnings.

The difference between the gross and the net (af-ter-tax) income indexes depends on eventual annual changes in the tax table (tax brackets) and in the tax allowances.

The change of net real earnings is calculated from the ratio of net income index and the consumer price index in the same period.

Non-manual workers are persons with occupations classified by the ISCO-88 in major groups 1-4., manual workers are persons with occupations classified in major groups 5-9. since 1st January 1994. Census data were used for the estimation of the employment data in 1980 and 1990. The aggregate economic data are based on national account statistics, the consumer's and producer's price statistics and industrial surveys. A detailed description of the data sources are to be found in the relevant publications of the Central Statistical Office.

## UNEMPLOYMENT (JOBSEEKERS') REGISTER DATABASE - FH REG

The other main source of unemployment data in Hungary - and in most of the developed countries - is the huge database containing so called administrative records which are collected monthly and include the individual data of the registered unemployed/jobseekers.

The register actually contains all jobseekers, but out of them, at a given point of time, only those are regarded as registered unemployed/jobseekers, who:

- had themselves registered with a local office of the National Employment Service as unemployed/jobseekers (i.e. he/she has got no job but wishes to work, for which they seek assistance from the labour market organisation).
- at a point of time (on the final day of any month), the person is not a pensioner or a full-time student, and
is ready to co-operate with the local employment office in order to become employed (i. e. he/she accepts the suitable job or training offered to him/her, and keeps the appointments made with the local employment office's placement officer/counsellor/benefit administrator).
If a person included in the register is working under any subsidised employment programme on the closing day, or is a participant of a labour market training programme, or has a short-term, temporary job her/his unemployed/jobseeker status is suspended.

If the client is not willing to co-operate with the local office he/she is removed from the register of the unemployed/jobseekers.

The data - i. e. the administrative records of the register - allow not only for the identification of date related stock data but also for monitoring flows: inflows as well as outflow within a period.

Based on the records of the labour requests needs reported to the National Employment Service, the stock and flow data of vacancies are also processed and published for each month.

Furthermore, detailed monthly statistics of participation in the different active programmes, number of participants and their inflows and outflows are also prepared monthly.

The very detailed monthly statistics - in a breakdown of country, region, county, local employment office service delivery area and community - build on the secondary processing of administrative records that are generated virtually as the rather important and useful "by-products" of the accomplishment of the National Employment Service's main functions (such as placement services, payment of benefits, active programme support, etc.).

The Employment Office (and its predecessors, i. e. OMK - National Labour Centre, OMMK and OMKMK) has published the key figures of these statistics on a monthly basis since 1989. The more detailed reports which also contain data by local office service delivery area are published by the County/Metropolitan (Budapest) Labour Centres.

The denominators of the unemployment rates calculated for the registered unemployed/jobseekers are the economically active population data published by the Central Statistical Office's Labour Market Account (KSH MEM).

The figures of the registered unemployed/jobseekers and the registered unemployment/jobseekers rate are obviously different from the figures based on the Cen-
tral Statistical Office's labour force survey. It is mainly the different conceptual approach, definition and the fundamentally different monitoring/measuring methods that account for this variance.

## SHORT-TERM LABOUR MARKET PROJECTION SURVEYS - FH PROG

At the initiative and under the co-ordination of the Employment Office (and its legal predecessors), the National Employment Service conducted the so called short term labour market survey since 1991, twice a year, in March and September. The survey uses an enormous sample, it contains over 4,500 employers. Since 2004 the survey is conducted once a year, in the month of October.

The interviews focus on the companies' projections of their material and financial processes, their development and human resource plans, and they are also asked about their concrete lay-off or recruitment plans as well as their expected need for any active labour market programmes.

The surveys are processed from bottom up, from the service delivery areas, through counties and regions to the whole country, providing useful information at all levels for the planning activities of the National Employment Service.

The survey provides an opportunity and possibility for the regions, the counties and Budapest to analyse in greater depth (also using information from other sources) the major trends in their respective labour markets, to make preparations for tackling problems that are likely to occur in the short term, and to effectively meet the ever-changing needs of their clients.

The forecast is only one of the outputs of the survey. Further very important "by-products" include regular and personal liaison with companies, the upgraded skills of the placement officers and other administrative personnel, enhanced awareness of the local circumstances, and the adequate orientation of labour market training programmes in view of the needs identified by the surveys. One of the most important by-products is the so called Labour Market Barometer, which shows the most wanted and mostly superfluous occupations, based on the recruitment and layoff plans of the employers.

The prognosis surveys are occasionally supplemented by supplementary surveys to obtain some further useful information that can be used by researchers and the decision-makers of employment and education/ training policy.

From 2005 the surveys are conducted in cooperation with the Institute for Analyses of the Economy and Entrepreneurship of the Hungarian Chamber of Industry and Commerce. Since then the main results are available on the internet also in the form of an interactive database.

## WAGE SURVEY DATABASE - FH BT

The Employment Office (and its legal predecessors) has conducted since 1992, once a year, a representative survey to investigate individual wages and earnings. The survey uses an enormous sample and is conducted at the request of the Ministry of National Resources (formerly: Ministry of Social Affairs and Labour, Ministry of Labour, Ministry of Social and Family Affairs, Ministry of Social Policy and Labour).

The reference month of data collection is the month of May in each year, but for the calculation of the monthly average of irregularly paid benefits (beyond the base wage/salary), the total amount of such benefits received during the previous year is used.

In the competitive sector, the data collection initially only covered companies of over 20 persons; it was incumbent on all companies to provide information, but the sample includes only employees born on certain dates in any month of any year.

Data collection has also covered companies of 10-19 since 1995, and companies of 5-9 have been covered since 2000, where the companies actually involved in data collection are selected at random (ca. 20 per cent) and the selected ones have to provide information about all their full-time employees.

Data on basic wages and earnings structure can only be retrieved from these surveys in Hungary, thus it is practically these huge, annually generated databases that can serve as the basis of the wage reconciliation negotiations conducted by the social partners.

In the budgetary sector all budgetary institutions provide information, regardless of their size, in such a way that the decisive majority of the local budgetary institutions - the ones that are included in the TAKEH central payroll accounting system - provide fully comprehensive information, and the remaining budgetary institutions provide information only about their employees who were born on certain days (regarded as the sample).

Data has only been collected on the professional members of the armed forces since 1999.

Prior to 1992, such data collection took place in every third year, thus we are in possession of an enormous
data base for the years of 1983, 1986 and 1989 too. Of the employees included in the sample, the following data are available:

- the sector the employer operates in, headcount, employer's local unit, type of entity, ownership structure - employee's wage category, job occupation, gender, age, educational background.
Based on the huge databases which include the data by individual, the data is analysed every year in the following ways:
- Standard data analysis, as agreed upon by the social partners, used for wage reconciliation negotiations (which is received by every confederation participating in the negotiations)
- Model calculations to determine the expected impact of the rise of the minimum wage
Analyses to meet the needs of the Wage Policy Department, Ministry of National Resources, for the comparison and presentation of wage ratios (total national economy, competitive sector, budgetary sector, and also by regions and counties).

The entire database is adopted every year by the Central Statistical Office, which enables the Office to also provide data for certain international organisations, (e. g. ILO and OECD). The Employment Office also regularly provides special analyses for the OECD.

The database containing the data by individual allows for a) the analysis of data for groups of people determined by any combination of pre-set criteria, b) the comparison of basic wages and earnings, with special regard to the composition of the different groups analysed, as well as c) the analysis of the dispersion of the basic wages and earnings.

Since 2002 the survey of individual wages and earnings was substantially developed to fulfill all requirements of the EU. So from this time it serves also for the purposes of the Structure of Earnings Survey (SES), which is obligatory for each member state in every fourth year (SES 2002 was the first and recently the database of SES 2006 was also sent to the Eurostat.)

Since 2003 the most important results of the Wage Survey are also available on the website of the Hungarian National Employment Service, since 2006 also in English (www.afsz.hu).

## UNEMPLOYMENT (JOBSEEKERS') BENEFIT REGISTER - FH REG

The recipients' fully comprehensive registry is made up, on the one hand, of the financial records containing
the disbursed unemployment benefits (unemployment benefit, school-leavers' unemployment benefit, pre-retirement unemployment benefit, jobseekers' benefit, jobseekers assistance) and, on the other hand, of the so-called master records containing the particulars of benefit recipients. This register allows for the accurate tracking of the recipients' benefit related events, the exact date of their inclusion in, and removal from, the system, as well as why they have been removed from it (e. g. got a job, eligibility period expired, were excluded, joined an active labour market programme, etc.)

This huge database allows for reporting for any point of time the detailed data of persons who received benefits on a given day, in a breakdown of country, region, county and local office service delivery area. In order to align these data with the closing day statistics of the registered unemployed, these monthly statistics are also completed by the 20th of each month. (Stock in the closing day.)

In addition, the monthly statistics also contain information on the number of those who were affected during the month, e.g. the number of those who have received benefits on any day of the month between the previous month's and the given month's closing day. Of course, data indicating inflows and outflows are also reported here.

It is an important and rather useful aspect from a research perspective that, in addition to the standard
closing day statistics, groups defined by any criteria can be tracked in the benefit register, e. g. inflow samples can be taken of newly registered persons for different periods, and through tracking them in the registry system the benefit allocation patterns of different cohorts can be compared.

The detailed data of unemployment benefit recipients have been available from the benefit register since January 1989. The first two years had a different benefit allocation system, and the current system, which has been modified several times since then, was implemented by the Employment Act of 1991 (Act IV).

For the period of between 1991 and 1996, the register also contains the stock and flow data of the recipients of school-leavers' unemployment benefit. Between 1997-2005 the system has also contained the recipients of pre-retirement unemployment benefit. In addition to headcount data, the benefit register can also monitor the average duration of the period of benefit allocation and the average monthly amount of the benefits allocated.

The key data regarding benefits were published by the Employment Office in the monthly periodical Labour Market Situation. In addition, time series data was published annually in the Time Series of the Unemployment Register, always covering the last six years in the form of a monthly breakdown. More recently these publications are available on the website of the Hungarian National Employment Service (www.afsz.hu).

[^11]:    Note: The calculations were carried out for the age group between 15-64 based on KSH labour force survey microdata. The probability of transition is given by the number of people who transitioned from one status to the other in the quarter, divided by the initial size of the group in the previous quarter, which were then corrected to preserve the consistency of stock flows. The red curves show the trend smoothed using a 4th degree polynomial.
